Much research has since demonstrated its safety in adults and children. Furthermore, many clinicians are co-administering ketamine or fentanyl in conjunction. This 2018 ACEP update¹ addresses these issues and much more. The following infographic summarizes the key points.

The Case

Monday, 23:00—You notice a worried mother pacing back and forth in front of another room. You speak with her and find that she is concerned about her daughter who is here with headaches and blurry vision. You find an obese 17-year-old female anxiously sitting on the ED stretcher. She says she can “deal” with the headaches she’s been having, but now that her vision is blurry, she is extremely upset and didn’t want to wait until morning to call her pediatrician. You anticipate a CT scan won’t provide much information and wonder what more you can do rapidly to assess her.

The chain-of-benefit for a diagnostic procedure

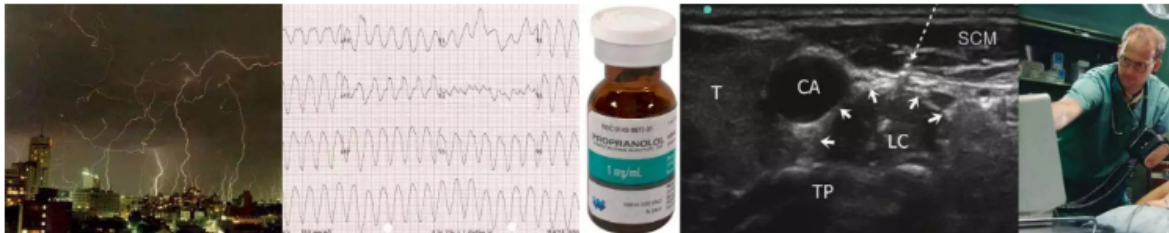

In order for a diagnostic procedure to benefit a patient, *every single one* of the above chain links must remain intact. If any link fails, the chain is broken and the procedure won't help the patient.

To illustrate this chain, let's walk through the links individually. We will use bronchoscopy and Swan-Ganz catheterization as illustrations, because these are classic examples of critical care procedures. However, these principles apply to any diagnostic procedure.

IBCC chapter: VT storm

April 18, 2019 by Josh Farkas — 4 Comments

Ventricular tachycardia (VT) storm refers to recurrent episodes of VT. Although any individual episode of VT can be broken, the overall process of recurrent arrests (or ICD shocks) creates a vicious cycle. Aggressive management is required including intubation, deep sedation, antiarrhythmics, and sympathectomy. Given the rarity of this condition, it's difficult to obtain high-level evidence or extensive experience. This chapter attempts to create an organized pathway, incorporating some emerging evidence regarding ultrasound-guided stellate ganglion blocks.
